

Photo 5. Location 2-b, wall beside apartments off Brittany Drive. 4cm pen top. Irregular shaped chert nodules in limestone block. White margins are calcareous whereas black cores are very finely crystalline quartz.

Photo 6. Location 2-b south, low cliff beside steps down to pond. 15 cm pen. Chert lenses in limestone lenses are aligned along a bedding surface that is parallel to laminations in the limestone. Laminations within the chert (not clear in photo) are parallel to those in the adjacent limestone in accord with preservation during chemical replacement of the limestone with the chert.
