Photo 9

Photo 10

Photos 9 and 10. Location 2-c, cliff face along driveway east side of St. Laurent Blvd. 15 cm pen. Limestone and thin black shale beds are crossed by washout channels, which are exposed in cross-section. The channels are filled with coarsely fragmental limestone. Steeply inclined, curved bedding, only apparent in the channel of photo 10, could reflect slumpage of soft sediments into the channel before deposition of overlying beds. The overlying and underlying beds were later compacted and deflected near the channel fill, which was relatively rigid.
